

About Enot Amsterdam

Enot Amsterdam is one of the largest spectacle lens and frames suppliers in the Netherlands, and has been established in the Optical Tech Industry for over 90 years. Enot employ a 'one-stop shop' principle to service independent opticians with an assortment of lenses and frames to provide quality in all segments. Enot has professionally trained consultants and sales staff with the expertise to advise and assist customers.

Our clients are both individual opticians and the larger chain stores, both nationally and internationally. The parent company of Enot is Polycore Optical in Singapore, one of the five major spectacle glass manufacturers of the world. Poly Core have successfully engaged on a global scale for decades, refining production processes which have resulted in the lowest possible prices and stable delivery.

A dignified existence for all 3,500 employees and attention to increasingly stringent environmental requirements play an important role to Polycore.

The Business Challenge

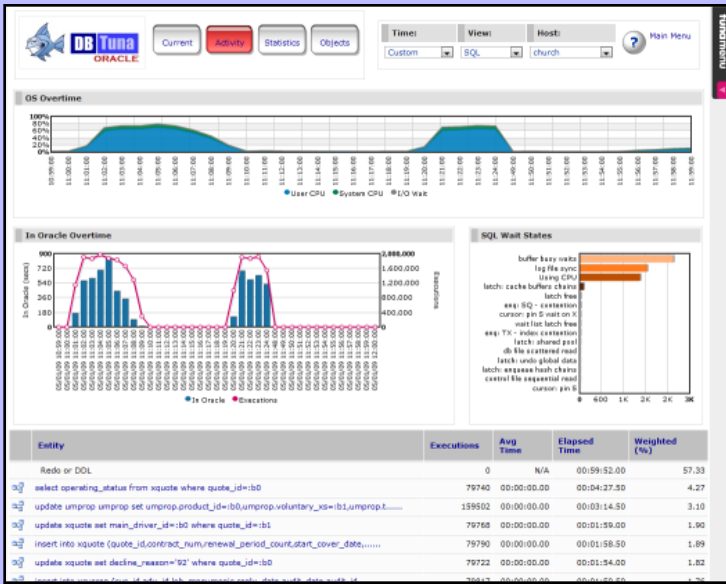

Enot utilizes a MySQL database server containing several hundred business tables. This database is maintained in-house and is continually adapted and expanded; this flexibility is one of the advantages of a modern relational database system. However, due to these regular changes and extensions, sometimes performance optimization is overlooked. Although there are never more than a few dozen active users, heavy SQL queries continually run on the server at peak times and it is essential that the database is optimally tuned.

What DBTuna showed Enot

We have found DBTuna a very easy to use program. Immediately after installation of the product it clearly identified that not all our MySQL server parameters were set optimally. It also identified various improvements in the index structure of the database. This information allowed us to make changes which led to a significant speed gain; without modifications of our software and most importantly without any communication by the end users!

DBTuna = 24x7 Performance Management for MySQL, SQL Server and Oracle

Key Features

- Low overhead - Production Safe
- Rapid Installation
- Agentless technology
- Detailed & comprehensive analysis
- Current & historical data

Rapidly identify the root cause of performance problems

About DBTuna

Application Performance created DBTuna as a web based solution for analysing database performance using the proven wait-time methodology. DBTuna provides visibility into every SQL statement and wait-event, highlighting those which are causing the most serious database issues.

Availability

DBTuna is currently available for MySQL, SQL Server, Sybase ASE and Oracle. Further modules are under development extending the reach of this new monitoring product.

DBTuna is generally purchased under an annually renewable subscription model, although other licence models may be available.
